Description**Technical Field**

5 The present invention relates to soap bars having improved wear rates.

Background

10 Soap bars which are either transparent or translucent have long been known. There have, however, been several problems associated with such bars. Often, the products are barely translucent. Highly transparent bars are known but these have high rates of wear, especially where the bars are produced by casting methods. Colour is a further problem that frequently requires improvement.

15 One of the first significant reports of clear soap bars is found in US Patent 2 820 768 (Fromont) which first coined the term "neutrogenous" indicating the presence of substantial quantities of acid neutralizing material, i.e. triethanolamine. The compositions of Fromont contain mixtures of 35-40wt% each of sodium and triethanolammonium soaps and substantial amounts of free triethanolamine. These products, produced by casting, have high rates of wear, are only borderline transparent and have a dark brown colour.

20 US Patent 4 741 854 (Krupa et al) is also based on triethanolamine casting technology. The patent reports achieving improved colour through the use of a combination of sulfur and hydride type reducing agents achieving bars of excellent transparency. The major problem with these bars is, however, that they have a high rate of wear being used up relatively quickly under normal hand washing conditions.

25 Alternative to the casting technology of Fromont and Krupa et al is that of high shear working of soap to reduce the size of solid crystals. Size reduction minimises or even eliminates light scattering by the solid crystals thereby achieving light transmission, i.e. clarity. For instance, US Patent 4 517 107 (Clarke et al) reports a soap-containing formulation becoming clear through shear working between two mutually displaceable surfaces in an apparatus known as a cavity transfer mixer. While products from this process have excellent wear and are readily manufactured, a translucent rather than a transparent product results.

30 GB 2 182 343 (Dawson et al) reports a beta-phase soap which is a mixture of solid soap and water-soluble polymer produced by a milling process. Lather characteristics are said to be much improved by use of the water-soluble polymer with no impairment of clarity. A diverse variety of suitable polymers were disclosed including copolymers derived from acrylic acid and/or methacrylic acid, cationic or nonionic guar gums and copolymers of dimethyldiallyl ammonium chloride/acrylamide and dimethyl aminoethyl-methacrylate/acrylamide copolymers. As with all high shear mixing processes, the bars of Dawson et al although claiming transparency are in fact at best only translucent. Similar types of polymers are 35 incorporated into syndet bars, as reported in US Patent 4 673 525 (Small et al), to improve skin feel and as a mildness aid.

40 EP 0 186 148A2 (Nagarajan) provides another report of milled syndet bars thickened with water-swellaable or water-soluble homo- and co-polymers incorporating acrylic acid. Improvements in humectancy, lather and cracking are noted. There is no indication given that any of these polymers are particularly suitable for reduction of wear in clear bars, especially those produced through casting.

Disclosure of Invention

45 According to the present invention there is provided a toilet bar characterized in that it comprises:

- (i) from about 10 to about 70% by weight of a C₈-C₂₂ fatty acid salt;
- (ii) from about 0.1 to about 3% by weight of a cellulosic polymer; and
- (iii) from about 0.1 to about 3% by weight of a water-soluble carboxylate polymer formed from a mixture of monomers comprising a water-soluble carboxylic containing vinyl monomer and a water-insoluble vinyl polymer, said water-insoluble vinyl monomer constituting at least 30 mole % of the polymer.

50 Compositions of the present invention can advantageously be prepared as a soap solution of low viscosity which is optically isotropic and non-birefringent. Both types of polymers are added to the isotropic soap solution prior to hardening of the bar. The combination of polymers from the cellulosic and carboxylate classes provides toilet bars having a significant improvement in rate of wear over bars containing each of the polymers individually while retaining a high degree of phase homogeneity. The present toilet bars can 55 moreover advantageously be produced by a casting process.

Thus according to the present invention, soap bar compositions of improved wear rates can be obtained by incorporation of a selected polymeric system within the bar. The system requires polymers selected from at least two different classes. These two classes of polymers synergistically interact to lower the bar's

rate of consumption but otherwise do not adversely impact upon phase homogeneity or washing effectiveness.

The first type of polymer found necessary is a water-soluble cellulosic material modified with either cationic or hydrophobic groups. Illustrative of this first category or Type A are the hydroxyalkyl alkylcellulose ethers, wherein the alkyl chain may vary from 1 to 18 carbons. Among the most preferred Type A polymers are methylcellulose, hydroxyethyl ethylcellulose and hydropropyl methylcellulose ethers.

Under Type A there may be employed cationic cellulosic polymers. Examples of such materials are hydroxypropyl trimethylammonium guar gum available under the trademark Jaguar^(R) from Hoechst-Celanese Corporation and quaternary ammonium substituted cellulose ethers available under the trademark Polymer JR^(R) and Celquat^(R) from Amerchol and National Starch Corporation, respectively.

The second or Type B polymer necessary is a water-soluble carboxylate polymer formed from a mixture of monomers which includes both a water-soluble carboxylic containing vinyl monomer and a water-insoluble vinyl monomer. The former promotes water-solubility or at least aqueous dispersibility by the carboxylate polymer. This monomer will be a C₃-C₆ alkanolic mono- or di-acid illustrative of which are acrylic acid, methacrylic acid, maleic acid or anhydride, itaconic acid, fumaric acid, mesaconic acid, crotonic acid and combinations thereof. Preferred are monomers of acrylic or methacrylic acids. The carboxylic containing vinyl monomer will preferably constitute from 5 to 70 mole % of the polymer.

The second monomer unit found in Type B polymers must promote some degree of hydrophobicity or decreased water solubility to the polymer. When incorporated into the polymer, this component should not readily be hydrated although it may be slightly water-soluble. Illustrative monomers of this variety include C₁-C₂₂-alkyl acrylates or methacrylates, N-C₁-C₂₂ alkyl acrylamides, styrene, vinyl acetate, vinyl chloride, C₂-C₂₂ olefins, and mixtures thereof. The second monomer unit normally will constitute from at least 30 to 95 mole % of the Type B polymer.

Other monomers may also be included in the Type B polymers to provide various effects in the final properties. For instance, monomers may be employed that can alter the polymer solubility, viscosity or glass transition temperature. Cross-linking agents such as divinylbenzene may be added to impart some degree of gelation or network formation. Polymerizable surfactant groups can be included to alter polymer rheology or associative behaviour. Illustrative are polyalkylene oxide blocks pendant from hydroxy or carboxy functionalized monomer units. These further monomers may be present anywhere from 0.1 to 10% of the final Type B polymer.

A further element of the invention is soap, technically referred to as a salt of a C₈-C₂₂ fatty acid. These fatty acids may be natural or synthetic aliphatic (alkanoic or alkenoic) acid salts. Soaps having the fatty acid distribution of coconut oil may provide the lower end of the broad molecular weight range. Those soaps having the fatty acid distribution of peanut, tallow or rapeseed oil, or their hydrogenated derivatives, may provide the upper end of the broad molecular weight range.

It is preferred to use soaps having the fatty acid distribution of coconut oil or tallow, or mixtures thereof, since these are among the more readily available fats. The proportion of fatty acids having at least 12 carbon atoms in coconut oil soap is about 85%. This proportion will be greater when mixtures of coconut oil and fats such as tallow, palm oil, or non-tropical nut oils or fats are used, wherein the principal chain lengths are C₁₆ and higher.

The soaps may contain unsaturation in accordance with commercially acceptable standards. Excessive unsaturation is normally avoided.

Salt counterions to the fatty acid may be those selected from alkali, ammonium or alkanolammonium ions. The term alkanolammonium refers to one, two or three C₁-C₄ hydroxyalkyl groups substituted onto a nitrogen cation, the triethanolammonium cation being the species of choice. Suitable alkali metal cations are those of potassium and sodium, the latter being preferred.

Soap, i.e. C₈-C₂₂ fatty acid salt, is present in amounts ranging from about 10 to 70% by weight. Preferably, the amount of soap will range from about 30 to 50% by weight.

A liquid solvent system is preferably also characteristic of the present compositions. For purposes of definition, the solvent system must comprise components liquid at room temperature. Water will preferably always be a component of the solvent. The amount of water may range from about 5 to about 35% by weight, preferably from about 10 to 25%.

Other than water, the solvent may include such liquids as alkanolamines, C₁-C₃ alcohols, polyols and mixtures thereof.

Alkanolamines may be present as soap counterions but also as solvent in their "free" state. For purposes of the present compositions, free alkanolamine refers to any molar excess alkanolamine beyond that which is required for neutralisation of any acid present in the bar composition.

Alkanolamine as used throughout this specification is intended to include C₁-C₃ mono-, di- and tri-alkanolamine species. For example, mono-, di- and/or tri-ethanolamine are suitable for the present invention. Particularly preferred, however, is triethanolamine. When present, the amount of free alkanolamine may range from about 10 to about 40% by weight.

Another component of the solvent system may be a polyol generally defined as a non-volatile di- or higher polyhydric alcohol, a sugar or a polyethylene glycol. Particular examples include propylene glycol, glycerol, sorbitol, sucrose and 400 molecular weight polyethylene glycol; glycerol is however preferred. When present, the amount of polyols will range from about 15 to about 40% by weight with respect to the total composition. Also desirable is to have a combination of alkanolamine to polyol in the weight ratio of 1:3 to 1:0.25.

Another type of solvent that may be useful in the present compositions are the C₁-C₄ alcohols. For example, these include ethanol and isopropyl alcohol, with the former being preferred. The amount of alcohol, when present, may range from about 1% to about 25% by weight with respect to the total composition.

Certain highly transparent forms of the present bar may be achieved through careful control of the relative ratios of certain components. Thus, a preferred bar will comprise a mixture of alkanolammonium and alkali metal C₁₂-C₂₂ fatty acid salts wherein the mole ratio of alkanolammonium to alkali metal fatty acid salt ranges from about 0.1 to less than 1.0. A liquid solvent system will also suitably be present that includes an amount of water and free alkanolamine in a weight ratio ranging from greater than 0.25 to less than 1.0, and wherein the weight ratio of total fatty acid salt to solvent ranges from greater than 0.02 to less than 1.0. A liquid solvent system will also suitably be present that includes an amount of water and free alkanolamine in a weight ratio ranging from greater than 0.25 to less than 1.0, and wherein the weight ratio of total fatty acid salt to solvent ranges from greater than 0.02 to less than 1.0.

Adjunct materials may include germicides, perfumes, electrolytes, preservatives and colourants. These ingredients normally will be in amounts less than 10% by weight of the composition, usually less than 5% by weight. Of course, care must be taken that the amount and type of these further additives do not cause crystallization of solid soap crystals, dissociation of alkanolammonium cations or other effects which adversely impinge upon phase homogeneity.

The present compositions described herein may be prepared by heating and mixing the components until they dissolve. Thereafter, the liquid compositions are allowed to cool and solidify. The mixture should be quiescent during this solidification. Nevertheless, the mixture may be poured into individual moulds before cooling and solidification, if desired. It may be particularly desirable for these moulds to be transparent.

For purposes of the present invention, it is important that the polymers be combined with the soap, solvent and other components to form an isotropic solution prior to hardening of the bar. Prior to hardening, the compositions of the present invention should have a viscosity ranging anywhere from 50 mPa·s (cps) to 2000 mPa·s (cps) at a shear rate of 21 sec⁻¹ as measured on a Haake Rotoviscometer at 65°C, preferably between 300 and 800 mPa·s (cps).

High shear processing is neither necessary for the solidified material to become clear nor desirable once solidification has begun as it can cause a loss of rigidity in the material. It should also be appreciated that these compositions do not require drying or maturation time to achieve optimal clarity. The polymers included in the present compositions should not be added to highly viscous or solid optically anisotropic, birefringent soap.

The soap bars covered by the present invention need not be clear; only phase homogeneity is required. Nevertheless, certain of the systems covered by this invention will have good clarity. The term "clear" as used in the specification indicates both transparent and translucent properties. A soap bar is deemed transparent if the maximum transmittance of light of any wavelength in the range of 200 to 800 nm through a sample 10cm thick is at least 1%. A bar is deemed translucent if the maximum transmittance of such light through the sample is between 0.01% and 1%. Finally, a bar is deemed opaque if the maximum transmittance of such light is below 0.01%; opaque bars are not considered clear within the context of this invention. Transmittance can be easily measured by placing a solid soap sample of the required thickness in the light beam path of a UV-VIS Spectrophotometer such as the Hewlett-Packard 845A1 Diode Array Spectrophotometer. The advantage of this method is that it is highly sensitive to optical clarity while independent of colour.

An alternative method of determining whether a soap bar is transparent may be found in US Patent 3 274 119 which defines transparency as a composition that allows bold face type of 14 point size to be easily read through a 1/4" section of material.

Embodiments of the present invention

The following examples will more fully illustrate the embodiments of this invention. All parts, percentages and proportions referred to herein and in the appended claims are by weight of the total composition unless otherwise stated.

EXAMPLE 1

A formulation typical of the present invention is found in Table I.

TABLE I

| Component | Weight% Concentration |
|------------------------------|-----------------------|
| Triethanolamine | 49.7 |
| Tallow/Coconut (82/18) Soap* | 22.87 |
| Stearic Acid | 6.4 |
| Coconut Fatty Acid | 4.7 |
| Sodium Bisulfite | 0.43 |
| Sodium Borohydride | 0.002 |
| Butyl Hydroxyanisole | 0.19 |
| Cellulosic Polymer | 0-2 |
| Carboxylate Polymer | 0-2 |
| Water | Balance |

* Includes 13% water.

Formulation of Polymer (Alcogum SL-98) into Bar

The following method was employed for formulating polymeric materials into phase homogeneous soap bars:

Into a 2-litre kettle equipped with mechanical stirrer and jacketed heating mantle were placed 526.5g of triethanolamine (TEA), 67.5g of stearic acid, and 49.6g of coconut fatty acid (Emery 625^(R)). The kettle was sealed and its contents heated to 60-70 °C. With continued stirring, a premix of 0.45g of sodium bisulfite (ex Fisher) and 0.22 g of sodium borohydride (ex Aldrich) were dissolved in 5.0g of water, and then added to the kettle. The contents melted and became transparent with a pale yellow colour. Next 245.56g of 82/18 tallow coconut soap (Na salt) and 2.0g of butylhydroxyanisole (BHA, ex Kodak) were added to the kettle. When these ingredients were dispersed thoroughly, 34.5g of the polymer (Alcogum SL-98, an associative thickener which comes as a 30wt% alkali-soluble aqueous emulsion) was diluted with the remaining water (138.08g) and added to the mixture. Once the solution became transparent, the soap was transferred to a mould.

EXAMPLE 2

A series of polymeric materials were tested for compatability in the bar formulation of Example 1. These results are summarised in Table II. The Table demonstrates that soap with only certain polymers remains phase homogeneous; this is due to polymer structure and content.

TABLE II

Compatibility of Polymers with the Bar Formula

| Polymeric Material | Supplier | Description | Appearance |
|------------------------------|---------------------|--|------------------|
| PPE-1042 (R) | National Starch Co. | Cross-linked Methacrylic acid/ Butylacrylate | Homogeneous |
| PPE-1068 (R) | National Starch Co. | " | Homogeneous |
| PPE-1069 (R) | National Starch Co. | " | Homogeneous |
| Acrysol ASE-60 (R) | Rohm & Haas | Cross-linked Styrene/Methacrylic Acid/Ethyl Acrylate | Homogeneous |
| Acrysol ASE-75 (R) | Rohm & Haas | " | Phase Separation |
| Alcogum SL-65 (R) (SL-98) | Alco | Methacrylic Acid/ Alkyl Acrylate/ Surfactant Monomer | Homogeneous |

Alcogum SL-98^(R).

Four grams of Polymer JR-400^(R) (Ex Amerchol) were added to 526.5 grams of TEA in a 2-litre resin kettle and dispersed well with a mixer at 23 °C. Next, 67.5 grams stearic acid and 49.6 grams of Emery 625^(R) were added to the TEA/polymer mixture. The kettle was then sealed and heated to 60 °C. With continued stirring, a premix of 0.45 grams of sodium bisulfite, 0.02 grams of sodium borohydride, and 5.0 grams of water was prepared and added to the kettle. Once the solution was clear, 214.50 grams of tallow/coconut (82/18) soap containing 2% water and 2.0 grams of BHA were added. Finally, a premix of 193.28 grams of water and 53.3 grams of Alcogum SL-98^(R) (30% aqueous dispersion) were added to the kettle. Stirring continued until the solution became clear. The kettle was removed from the heat and the contents (which were a light yellow colour) were poured into a plastic mould and cooled at 23 °C for several hours (until hardened). The moulded soap was then cut into bars.

The rate of wear of the different bars was measured using the following procedure:

The soap bars were stamped to ensure uniform size and shape by placing four bars into the stamping moulds. Moulding the soap from flat to convex bars was accomplished by manual cranking of the press. Each bar then was measured for length, width, depth, and initial mass. Each bar was then submerged mid-length into water at 35 °C for 30 minutes. Afterwards, each bar was weighed. Then, the "mush" layer of the bar was scraped away with a toothbrush handle followed by reweighing of the bar. The bar was air dried at 24 hours and the final mass determined. The rate of dissolution of % mass loss was calculated for each bar. Each series tested consisted of four bars containing polymer, and a control with no polymer.

In Table III, the % improvement for several polymers and polymer combinations is shown. The term "% improvement" is defined in the following way:

% Improvement =

$$\frac{\% \text{ mass loss (control)} - \% \text{ mass loss (experimental)} \times 100}{\% \text{ mass loss (control)}}$$

where the control is the bar containing no polymer, and the experimental is the bar containing the polymer or combinations of polymers.

Table III illustrates the synergistic effects obtainable by combinations of Type A and B polymers in soap formulations.

TABLE III

Combinations of Polymers in Soap Formulations

| <u>Polymeric Additive(s)</u> | <u>Appearance of Bar</u> | <u>% Wear Rate Improvement</u> |
|--|---|------------------------------------|
| <u>Control:</u> None | Homogeneous | 0 |
| <u>Test 1:</u> 0.4% Polymer JR-400 ^(R) [1] 0.4% Alcogum SL-70 ^(R) 0.2% Polymer JR ^(R) , 0.2% Alcogum ^(R) | Homogeneous Homogeneous Homogeneous | 6.1 17.5 30.1 |
| <u>Test 2:</u> 0.5% Amerchol LM-200 ^(R) [1] 0.5% Alcogum SL-70 ^(R) 0.25% Amerchol ^(R) , 0.25% Alcogum ^(R) | Homogeneous Homogeneous Homogeneous | 9.5 7.5 15.2 |
| <u>Test 3:</u> 0.4% Polymer JR-400 ^(R) 0.8% Alcogum SL-98 ^(R) [2] 0.2% Polymer JR ^(R) , 0.4% Alcogum ^(R) | Homogeneous Homogeneous Homogeneous | 6.1 0 11.6 |

TABLE III

Combinations of Polymers in Soap Formulations

| <u>Polymeric Additive(s)</u> | <u>Appearance of Bar</u> | <u>% Wear Rate Improvement</u> |
|------------------------------|------------------------------|------------------------------------|
| <u>Test 4:</u> | | |
| 0.4% Amerchol LM-200 (R) | Homogeneous | 9.9 |
| 0.4% PPE-1042 (R) [3] | Homogeneous | 9.9 |
| 0.2% Amerchol (R) | Homogeneous | 16.9 |
| 0.2% PPE-1042 (R) | | |
| <u>Test 5:</u> | | |
| 1% Amerchol LM-200 (R) | Homogeneous | 13.4 |
| 1% PPE-1042 (R) | Homogeneous | 23.3 |
| 0.5% Amerchol (R) | Homogeneous | 31.8 |
| 0.5% PPE-1042 (R) | | |
| <u>Test 6:</u> | | |
| 3% Amerchol LM-220 | Phase Separation | NM |
| 3% PPE-1042 (R) | Severe Phase Separation | NM |
| 1.5% Amerchol (R) | | |
| 1.5% PPE-1042 (R) | Homogeneous | 48.0 |

NM - Not measurable because phase separation prevented moulding of bars with reproducible composition and properties.

[1] Polymer JR-400^(R) and Amerchol LM-200^(R) are cationically-modified cellulose of molecular weight 400,000 both available from Amerchol, Inc.

[2] The Alcogums are terpolymers of methacrylic acid (40-50%), methyl methacrylate or alkyl acrylate (40-50%), and a polymerizable surfactant monomer (app. 1%). They are sold by Alco Chemical Co. as 30% dispersions in water.

[3] PPE-1042^(R) is an alkali-soluble emulsion sold as a 30% solids dispersion in water by National Starch and Chemical Co. It contains about 40-50% butyl acrylate and about 40-50% methacrylic acid with a small amount of a cross-linking monomer.

The results in Table III indicate that at constant amounts of polymer in the formula, combinations of two polymers, one from each of the selected types, show a synergistic improvement in rate of wear over individual polymers.

EXAMPLE 4

The following experiments were conducted to correlate physical properties of bar hardness and viscosity in various of the polymer-containing soap compositions. Table IV lists these results.

TABLE IV

| Total Polymer Conc. (wt%) | Type A Polymer | Type B (see below) | % Wear Rate Improvement | Viscosity (65 C,21/s) (cp) mPa·s |
|---------------------------|----------------|--------------------|-------------------------|----------------------------------|
| 0 | 0 | 0 | 0 | 460 |
| 0.5 | 0.5 | 0 | 9.5 | 380 |
| 0.5 | 0 | 0.5 AT | 7.5 | 410 |
| 0.5 | 0.25 | 0.25 AT | 15.2 | 410 |
| 1.0 | 1.0 | 0 | 13.4 | 500 |
| 1.0 | 0 | 1.0 EP | 23.3 | 520 |
| 1.0 | 0.5 | 0.5 EP | 31.8 | 560 |
| 2.0 | 2.0 | 0 | 35.6 | 500 |
| 2.0 | 0 | 2.0 AT | * | * |
| 2.0 | 1.0 | 1.0 AT | 32.1 | 640 |
| 3.0 | 3.0 | 0 | * | * |
| 3.0 | 0 | 3.0 EP | * | * |
| 3.0 | 1.5 | 1.5 EP | 48.0 | 1800 |

Type A (Cellulosics): Amerchol LM-200^(R) (Amerchol).
 Type B: AT = Alcogum SL-70^(R) (Alco), EP = PPE-1042^(R) (National Starch).
 * Polymer was incompatible in the soap formulation, resulting either in phase separation or inhomogeneity. This prevented moulding of bars with reproducible composition and properties.

Table IV indicates that there is some correlation between the viscosity and % wear rate improvement for each total polymer concentration.

Claims

- A toilet bar characterised in that it comprises:
 - from about 10 to about 70% by weight of a C₈-C₂₂ fatty acid salt;
 - from about 0.1 to 3% by weight of a cellulosic polymer; and
 - from about 0.1 to about 3% by weight of a water-soluble carboxylate polymer formed from a mixture of monomers comprising a water-soluble carboxylic containing vinyl monomer and a water-insoluble vinyl monomer, said water-insoluble monomer constituting at least 30 mole % of the polymer.
- A toilet bar according to claim 1 wherein the cellulosic polymer is selected from the group consisting of hydroxyalkyl alkylcellulose ether, quaternized ammonium cellulose ether and mixtures thereof.
- A toilet bar according to claim 1 wherein the carboxylic containing vinyl monomer is selected from the group consisting of acrylic acid, methacrylic acid, maleic acid, itaconic acid, fumaric acid, crotonic acid and mixtures thereof.
- A toilet bar according to claim 1 wherein the water-insoluble vinyl monomer is selected from the group consisting of C₁-C₂₂-alkyl acrylates or methacrylates, N-C₁-C₂₂ alkyl acrylamides, styrene, vinyl acetate, vinyl chloride, C₂-C₂₂ olefins, and mixtures thereof.
- A toilet bar according to claim 1 wherein the cellulosic polymer is present in an amount from about 0.2 to 1.5% by weight.
- A toilet bar according to claim 1 wherein the carboxylate polymer is present in an amount from about 0.2 to 1.5% by weight.
- A toilet bar according to claim 1 wherein polymers (ii) and (iii) are added to an isotropic solution of the fatty acid salt prior to hardening of the bar.

8. A toilet bar according to claim 7 wherein said isotropic solution containing said polymers, prior to hardening, will have a viscosity ranging from about 50 mPa·s (cps) to about 2,000 mPa·s (cps) at a shear rate of 21 sec^{-1} as measured on a Haake Rotoviscometer at 65 °C.
- 5 9. A toilet bar according to claim 8 wherein said viscosity ranges between 300 and 800 mPa·s (cps).
10. A toilet bar according to claim 1 comprising from about 5 to about 35% by weight of water.
11. A toilet bar according to claim 1 comprising from about 10 to 40% by weight of an alkanolamine.
- 10 12. A toilet bar according to claim 1 comprising from about 15 to about 40% by weight of a polyol.
13. A toilet bar according to claim 1 comprising from about 1% to about 25% by weight of a C₁-C₄ alcohol.
- 15 14. A toilet bar according to claim 1 having a transmittance of at least 0.01% of light of any wavelength in the range 200 to 800 nm through a sample 10cm thick.
15. A toilet bar according to claim 14 wherein said transmittance is at least 1%.
- 20 16. The use in a toilet bar, containing from about 10 to about 70% by weight of a C₈-C₂₂ fatty acid salt, of a combination of two polymers to improve bar properties, characterised in that the polymers comprise
 - (i) from about 0.1 to 3% by weight of a cellulosic polymer and
 - (ii) from about 0.1 to about 3% by weight of a water-soluble carboxylate polymer formed from a mixture of monomers comprising a water-soluble carboxylic containing vinyl monomer and a water-insoluble vinyl monomer, said water-insoluble monomer constituting at least 30 mole % of the polymer
 25 and in that the use is to improve the rate of wear of the bar.

Patentansprüche

- 30 1. Toilettenseifestück, dadurch gekennzeichnet, daß es die folgenden Bestandteile umfaßt:
 - (i) etwa 10 bis etwa 70 Gew.-% eines C₈-C₂₂-Fettsäuresalzes;
 - (ii) etwa 0,1 bis 3 Gew.-% eines Cellulosepolymers und
 - (iii) etwa 0,1 bis etwa 3 Gew.-% eines aus einem Gemisch von Monomeren mit einem wasserlöslichen carboxylgruppenhaltigen Vinylmonomer und einem wasserunlöslichen Vinylmonomer, wobei
 35 das wasserunlösliche Monomer mindestens 30 Mol-% des Polymers ausmacht, gebildeten wasserlöslichen Carboxylatpolymers.
2. Toilettenseifestück nach Anspruch 1, wobei das Cellulosepolymer aus der Gruppe Hydroxyalkylalkylcelluloseether, quaternisierter Ammoniumcelluloseether und Gemischen hiervon ausgewählt ist.
- 40 3. Toilettenseifestück nach Anspruch 1, wobei das carboxylgruppenhaltige Vinylmonomer aus der Gruppe Acrylsäure, Methacrylsäure, Maleinsäure, Itaconsäure, Fumarsäure, Crotonsäure und Gemischen hiervon ausgewählt ist.
- 45 4. Toilettenseifestück nach Anspruch 1, wobei das wasserunlösliche Vinylmonomer aus der Gruppe C₁-C₂₂-Alkylacrylate oder -methacrylate, N-C₁-C₂₂-Alkylacrylamide, Styrol, Vinylacetat, Vinylchlorid, C₂-C₂₂-Olefine und Gemische hiervon ausgewählt ist.
- 50 5. Toilettenseifestück nach Anspruch 1, wobei das Cellulosepolymer in einer Menge von etwa 0,2 bis 1,5 Gew.-% vorhanden ist.
6. Toilettenseifestück nach Anspruch 1, wobei das Carboxylatpolymer in einer Menge von etwa 0,2 bis 1,5 Gew.-% vorhanden ist.
- 55 7. Toilettenseifestück nach Anspruch 1, wobei die Polymere (ii) und (iii) einer isotropen Lösung des Fettsäuresalzes vor einem Aushärten des Seifestückes zugesetzt werden.

8. Toilettenseifestück nach Anspruch 7, wobei die die Polymere enthaltende isotrope Lösung vor einem Härten eine Viskosität im Bereich von etwa 50 mPa·s (cps) bis etwa 2000 mPa·s (cps) bei einer Scherrate von 21 s^{-1} gemäß einer Bestimmung auf einem Haake Rotoviskosimeter bei 65°C aufweist.
9. Toilettenseifestück nach Anspruch 8, wobei die Viskosität in einem Bereich von 300 bis 800 mPa·s (cps) liegt.
10. Toilettenseifestück nach Anspruch 1, das etwa 5 bis etwa 35 Gew.-% Wasser umfaßt.
11. Toilettenseifestück nach Anspruch 1, das etwa 10 bis 40 Gew.-% eines Alkanolamins umfaßt.
12. Toilettenseifestück nach Anspruch 1, das etwa 15 bis etwa 40 Gew.-% eines Polyols umfaßt.
13. Toilettenseifestück nach Anspruch 1, das etwa 1 bis etwa 25 Gew.-% eines C_1 - C_4 -Alkohols umfaßt.
14. Toilettenseifestück nach Anspruch 1 mit einer Transmission von Licht einer beliebigen Wellenlänge im Bereich von 200 bis 800 nm durch eine Probe einer Dicke von 10 cm von mindestens 0,01%.
15. Toilettenseifestück nach Anspruch 14, wobei die Transmission mindestens 1% beträgt.
16. Verwendung einer Kombination von zwei Polymeren in einem etwa 10 bis etwa 70 Gew.-% eines C_8 - C_{22} -Fettsäuresalzes enthaltenden Toilettenseifestück zur Verbesserung der Seifenstückeigenschaften, dadurch gekennzeichnet, daß die Polymere
 - (ii) etwa 0,1 bis 3 Gew.-% eines Cellulosepolymers und
 - (iii) etwa 0,1 bis etwa 3 Gew.-% eines aus einem Gemisch von Monomeren mit einem wasserlöslichen carboxylgruppenhaltigen Vinylmonomer und einem wasserunlöslichen Vinylmonomer, wobei das wasserunlösliche Monomer mindestens 30 Mol-% des Polymers ausmacht, gebildeten wasserlöslichen Carboxylatpolymers umfassen, und
 dadurch, daß die Verwendung darin besteht, die Abnutzungsrate des Seifenstücks zu verbessern.

Revendications

1. Savonnette, caractérisée en ce qu'elle comprend :
 - (i) d'environ 10 à environ 70 % en poids d'un sel d'un acide gras en C_8 - C_{22} ;
 - (ii) d'environ 0,1 à environ 3 % en poids d'un polymère cellulosique ; et
 - (iii) d'environ 0,1 à environ 3 % en poids d'un polymère d'un carboxylate soluble dans l'eau, formé à partir d'un mélange de monomères comprenant un monomère vinylique carboxylé soluble dans l'eau et un monomère vinylique insoluble dans l'eau, le monomère vinylique insoluble dans l'eau constituant au moins 30 % en moles du polymère.
2. Savonnette selon la revendication 1, dans laquelle le polymère cellulosique est choisi parmi l'ensemble comprenant l'éther d'hydroxyalkylalkylcellulose, l'éther de cellulose d'ammonium quaternisé et leurs mélanges.
3. Savonnette selon la revendication 1, dans laquelle le monomère vinylique carboxylique est choisi parmi l'ensemble comprenant l'acide acrylique, l'acide méthacrylique, l'acide maléique, l'acide itaconique, l'acide fumarique, l'acide crotonique et leurs mélanges.
4. Savonnette selon la revendication 1, dans laquelle le monomère vinylique insoluble dans l'eau est choisi parmi l'ensemble comprenant les acrylates ou méthacrylates d'alkyle en C_1 - C_{22} , les N-(alkyle en C_1 - C_{22})-acrylamides, le styrène, l'acétate de vinyle, le chlorure de vinyle, les oléfines en C_2 - C_{22} et leurs mélanges.
5. Savonnette selon la revendication 1, dans laquelle le polymère cellulosique est présent en une quantité d'environ 0,2 à 1,5 % en poids.
6. Savonnette selon la revendication 1, dans laquelle le polymère d'un carboxylate est présent en une quantité d'environ 0,2 à 1,5 % en poids.

7. Savonnette selon la revendication 1, dans laquelle les polymères (ii) et (iii) sont ajoutés à une solution isotrope du sel d'acide gras avant durcissement de la savonnette.
- 5 8. Savonnette selon la revendication 7, dans laquelle la solution isotrope contenant les polymères, avant durcissement, a une viscosité comprise entre environ 50 et environ 2000 mPa.s (cP) pour une vitesse de cisaillement de 21 s^{-1} , mesurée au viscosimètre rotatif Haake à 65°C .
9. Savonnette selon la revendication 8, dans laquelle la viscosité est comprise entre 300 et 800 mPa.s (cP).
- 10 10. Savonnette selon la revendication 1, qui comprend d'environ 5 à environ 35 % en poids d'eau.
11. Savonnette selon la revendication 1, qui comprend d'environ 10 à 40 % en poids d'une alcanolamine.
- 15 12. Savonnette selon la revendication 1, qui comprend d'environ 15 à environ 40 % en poids d'un polyol.
13. Savonnette selon la revendication 1, qui comprend d'environ 1 à environ 25 % en poids d'un alcool en $\text{C}_1\text{-C}_4$.
- 20 14. Savonnette selon la revendication 1, qui présente un facteur de transmission d'au moins 0,01 % d'une lumière ayant une longueur d'onde quelconque comprise entre 200 et 800 nm à travers un échantillon de 10 cm d'épaisseur.
15. Savonnette selon la revendication 14, dont le facteur de transmission est d'au moins 1 %.
- 25 16. Utilisation dans une savonnette contenant d'environ 10 à environ 70 % en poids d'un sel d'un acide gras en $\text{C}_8\text{-C}_{22}$, d'une combinaison de deux polymères pour améliorer les propriétés de la savonnette, caractérisée en ce que les polymères comprennent :
 - (ii) d'environ 0,1 à environ 3 % en poids d'un polymère cellulosique ; et
 - 30 (iii) d'environ 0,1 à environ 3 % en poids d'un polymère d'un carboxylate soluble dans l'eau, formé à partir d'un mélange de monomères comprenant un monomère vinylique carboxylé soluble dans l'eau et un monomère vinylique insoluble dans l'eau, le monomère vinylique insoluble dans l'eau constituant au moins 30 % en moles du polymère,
 - 35 et en ce que l'utilisation a pour but d'améliorer le taux d'usure de la savonnette.
